

Pablings "Trust-Lock" Revenue & Management System

1. Core Concept Overview

To eliminate collusion fraud (staff and barbers hiding cash or digital transactions), the Pablings "Trust-Lock" Revenue & Management System enforces a seamless Scan-to-Wait, Refresh-to-Verify operational engine. By moving the point of initial data creation entirely from the counter staff to the customer's personal device, the platform traps headcount and service parameters in the cloud before a barber ever touches a pair of shears, completely removing the opportunity for staff to run services "off-the-books."

The business rules are streamlined to prioritize speed, simplicity, and non-BIR compliance:

- **The Customer Initiates the Audit:** The customer scans the entry checkpoint QR code to request a queue placement, permanently anchoring their service selection and fixed corporate pricing parameters into the Supabase database.
- **The Staff Finalizes the Record:** Once the service concludes and external manual payment (Cash, GCash, or card) is settled, the receptionist uses a one-tap closure on the tablet terminal to submit and post the session. Because the database entry cannot be deleted or bypassed by staff, every single haircut leaves a permanent digital paper trail. Any attempts to discard or modify sessions are tracked as locked "Cancelled/Voided" metadata directly visible on the Owner's Dashboard.
- **The Customer Enforces the Closure:** Instead of being forced to perform a tedious checkout scan to leave, the customer simply refreshes their mobile browser dashboard at the front counter. Because consumers actively protect their milestone reward points, they will immediately demand validation from the receptionist if their point balance fails to update in real-time, completely neutralizing floor-level cash pocketing.

2. Detailed Operational Workflow

Phase 1: Digital Entrance (The Check-In)

Goal: Secure the branch headcount and service parameters in the cloud database before staff or barbers can manipulate data logs or bypass system records.

Scenario A: First-Time Customer Flow

- **Step 1: [CUSTOMER] Counter Signage Awareness & Static QR Scan**
 - **The Action:** Upon arriving at the Pablings branch, the first-time walk-in customer is immediately exposed to high-visibility marketing collaterals and acrylic counter displays featuring the brand's primary audit campaign slogan: **"Check Your Loyalty Points Before You Leave — No Points Logged Means Your Haircut is FREE!"** To initialize their visit, the customer opens their smartphone camera and scans the permanent Static QR Code Stand located on the reception counter.

- **The Strategic Logic:** Introducing this revised auditing slogan at the entry point frames the customer's psychology right away. Instead of burdening them with a tedious checkout scan at the end of their visit, it links their role as an auditor to their personal reward progress. It ensures that while they are waiting or getting their hair cut, they are already anticipating and prepared to review their mobile screen to verify that their points update the second they settle their bill.
- **Step 2: [CUSTOMER] Account Creation, Credential Setup, Service Selection & QR Generation**
 - **The Action:** The customer fills out a streamlined digital registration form directly on their smartphone's mobile browser to establish their permanent profile. To create a secure account, the interface requires the user to input their **FullName, Mobile Number, a unique Username, and an Account Password**.
 - **The Staff Guidance Script:** The receptionist politely guides the first-time client through the self-service registration layout:

"Good morning, Sir! Welcome to Pablings. Please open the registration page on your phone, create your personal username and password account, select the service you want to avail today from the menu, and then tap 'Generate QR'."
 - **The Service Selection:** Directly underneath the profile credential creation boxes on their phone screen, the customer selects their intended service from an unalterable interactive menu layout (e.g., Haircut - ₱300) and taps "Generate Check-In QR."
 - **System Result:** The mobile-responsive portal pushes the completed registration payload along with the service selection parameters directly to the centralized Supabase database instance. This records a permanent client profile row and instantly logs an unverified **Draft Transaction** row. The customer's mobile display then renders a visit-specific Check-In QR Code, ready for staff assignment verification.
- **Step 3: [STAFF] The Digital Handshake & Automated Visual Assignment**
 - **The Action:** The customer presents the generated Check-In QR code from their phone screen. The receptionist scans it using the integrated camera of the Staff Terminal Tablet.
 - **The Interface Popup:** The terminal instantly decodes the token. A rapid assignment modal window automatically opens on the tablet screen displaying the customer's self-selected choice. This completely locks the service price, preventing unauthorized staff modifications, off-the-books swaps, or unrecorded employee discounts:

Customer Name: New User (Validated Profile Name)

Service Selected: Haircut (Pre-selected by the customer; locked from editing) ●

Select Barber: (Visual touch cards) [Barber Mark (Available)] [Barber Alex (Busy)] [Barber John (Available)]

Select Chair/Seat: (Visual touch cards) [Seat 1 (Vacant)] [Seat 2 (Occupied)] [Seat 3 (Vacant)]
 - **The Interaction:** The receptionist's only required operational task is mapping the physical layout of the shop. They quickly tap an available Barber Card and a matching vacant Seat Card, then click "Confirm Assignment."
 - **The Dialogue (Assignment Confirmation):** The receptionist finalizes the step and directs the client to the designated grooming station:

"All set, Sir! I have confirmed your Haircut request. You are officially assigned to Barber Mark at Seat 1. You may proceed to his station now. Enjoy your haircut!"
 - **System Result:** The draft transaction records an instantaneous status transition to **"In-Chair (Active)"** in the centralized cloud database. The selected chair icon automatically changes to Blue (In-Service) on the live Owner's Dashboard, locking down the session record and initiating the real-time service tracking timer.

Scenario B: Returning Customer Flow (Revisit)

- **Step 1: [CUSTOMER] Counter Signage Re-Exposure & Static QR Scan**
 - **The Action:** The returning customer walks into the branch and is re-exposed to the prominent countertop acrylic signs stating: **"Check Your Loyalty Points Before You Leave — No Points Logged Means Your Haircut is FREE!"** The regular client opens their smartphone camera and scans the identical permanent Static QR Code Stand displayed on the reception counter.
 - **The Strategic Logic:** Reinforcing the audit campaign slogan at every single visit ensures that even veteran regular clients remain vigilant. It keeps the core loyalty progression milestone top-of-mind, maintaining an un-briable consumer-led audit expectations line right at the counter for when the receptionist completes the transaction later on.
- **Step 2: [CUSTOMER] Credential Authentication, Service Selection & Draft Creation**
 - **The Authentication:** Upon scanning the countertop static QR code, the mobile portal displays a clean, lightweight access gateway. The returning customer keys in their basic registered **Username/Mobile Number and Password credentials**.

- **The Recognition Logic:** Upon a successful backend validation check, the system securely matches their account token to their unique Customer ID profile. The interface dynamically updates to load their personalized revisit panel, rendering a custom header greeting: *"Welcome back, [Customer Name]!"* alongside an unalterable, real-time visual index of their currently accumulated milestone loyalty point balances.
- **The Staff Guidance Script:** The receptionist welcomes the authenticated regular client and guides them through the rapid checkout-priming step:

"Welcome back, Sir! Good to see you again. Please log into your profile on the screen, tap your desired service, and click 'Generate QR' so we can scan you straight into an available station."
- **The Action:** Directly inside their mobile dashboard layout, the customer taps their intended option from the locked service catalog layout (e.g., Haircut - ₱300) and hits "Generate Check-In QR."
- **System Result:** The web platform pushes an instant data payload to the central Supabase database instance, recording an unverified **Draft Transaction** row bound securely to that specific client record. The customer's phone display instantly renders a fresh, visit-specific Check-In QR Code, keeping the execution path perfectly aligned with the standard operational verification loop.
- **Step 3: [STAFF] The Digital Handshake & Automated Visual Assignment**
 - **The Action:** The customer presents their visit-specific QR code, and the receptionist scans it using the integrated front camera of the Staff POS Tablet Terminal.
 - **The Interface Popup:** The Staff Terminal reads the draft payload. The visual assignment popup modal instantly appears on the tablet screen with the customer's details pre-filled directly from their smartphone selection. This keeps the service and pricing parameters completely tamper-proof and unalterable by the branch operator:

Customer Name: Juan Dela Cruz (Returning Customer Status)

Service Selected: Haircut (Pre-selected by the customer; locked from editing) ●
 - Select Barber:** (Visual touch cards) [Barber Mark (Available)] [Barber Alex (Busy)] [Barber John (Available)]
 - Select Chair/Seat:** (Visual touch cards) [Seat 1 (Vacant)] [Seat 2 (Occupied)] [Seat 3 (Vacant)]
 - **The Interaction:** The receptionist performs the sole remaining technical task on the digital floor plan layout: tapping an available Barber Card and a corresponding vacant Seat Card, then clicking "Confirm Assignment."
 - **The Dialogue (Assignment Confirmation):** The receptionist finalizes the registration loop and smoothly directs the client to the station:

"Got it, Sir! Your Haircut is logged. You are all set with Barber Mark at Seat 1. You may proceed to his station now. Have a great cut!"
 - **System Result:** The visit row transitions to an **"In-Chair (Active)"** status inside the centralized cloud database. This automatically kicks off the real-time session timer and shifts the corresponding station asset block color to Blue (In-Service) on the live Owner's Dashboard.

Phase 2: Active Service (Real-Time Monitoring)

- **Step 4: [BARBER] Service Execution**
 - **The Action:** The barber performs the haircut. On the Owner Dashboard, the specific chair remains Blue (In-Service) with a running live session timer tracking the duration of the cut.
 - **Anti-Fraud Audit:** The owner can cross-reference live CCTV feeds with the active dashboard states. If 5 people are physically getting haircuts but only 2 chairs are logged as "Active" on the dashboard, a branch discrepancy is caught instantly. Because the system records the initial timestamp immediately during Phase 1, staff cannot delay logging sessions until the end of the day to hide foot traffic.

Phase 3: Internal Audit Closure (The Revenue Lock)

Goal: Lock the exact transaction value into the gross volume calculation to protect brand integrity and track operational metrics without relying on customer checkout friction or real-time payment network dependencies.

- **Step 5: [CUSTOMER & STAFF] External Settlement (Off-System Payment)**
 - **The Action:** Once the service concludes, the customer walks up to the front desk or cashier counter to pay. The customer handles their final payment manually through external cash or a direct digital transfer (e.g., scanning an independent branch GCash QR stand).
 - **Non-BIR Regulatory Safeguard:** The software terminal remains **completely independent of this financial exchange step**. It does not process card swipes, calculate tax tables, handle cash drawers, or produce official commercial invoices. It operates purely as an operational audit ledger measuring headcount duration and milestone rewards.
- **Step 6: [STAFF] Core Submission & Posting Logs**

- **The Action:** On the Staff Terminal tablet interface, the receptionist selects the active chair (e.g., [Seat 1]) and clicks [Confirm Payment & Post Session].
- **The Automation:** Because the service type and price were already bound to the database row during the check-in phase via the customer's phone selection, the system automatically draws up the exact required value (e.g., Haircut - ₱300). **The staff has zero input text boxes for pricing or service changes at checkout.** Tapping confirm posts the completed record to the cloud.
- **System Reset Workflow:** The moment the receptionist hits submit, the terminal app clears the active modal window instantly and **automatically routes the user back to the primary Main Shop Floor Grid view** to prepare for the next walk-in scan.
- **Step 7: [CUSTOMER] Real-Time Points Refresh & Verification Audit**
 - **The Action:** Simultaneously, as the receptionist posts the session on the tablet, the backend automatically calculates and appends the corresponding loyalty point balances to the client's account table. Standing at the counter, the customer simply opens their personal smartphone browser and taps refresh on their active dashboard profile page to view their newly updated milestone point balances.
 - **Anti-Fraud Audit Enforcer:** Since the customer expects their loyalty points to update immediately, they act as the system's absolute field manager. If a counter operator takes cash privately under the table and fails to post the session on the tablet, the client's points will not update. The customer will immediately challenge the staff member at the counter to claim their rewards, locking down floor-level theft through immediate consumer expectation.

3. The "Anti-Fraud" System Logic

The Staff/Branch Trick	How the "Trust-Lock" System Stops It
"Let's not record this haircut, we can just split the cash privately."	The staff cannot bypass the system because the customer creates a Draft Transaction on their own phone before the service even begins. Once the receptionist scans that Draft QR to start the session, the customer is locked into the cloud database. If the staff attempts to let the customer leave without checking out, the chair remains permanently stuck as "In-Chair (Active)" on the live Owner's Dashboard, exposing the fraud. Consumer Enforcement: If staff tries to ask for cash under the table without scanning the checkout QR code, the customer will refuse and demand the scan because the counter sign clearly states that no checkout scan means a free haircut. If the staff forces the issue and lets the customer leave casually, the chair remains permanently stuck as "In-Chair (Active)" on the live Owner's Dashboard, triggering a critical alert.
"I'll just cancel or delete this active session row on the tablet to clear	Loopholes Blocked: Floor staff are completely stripped of database deletion rights. If a receptionist

the stuck blue chair and hide the money."	attempts to drop or clear an erroneous active chair, the record is permanently saved and flipped to a locked "Cancelled/Voided" metadata state . The transaction does not vanish from the system; it immediately moves to a dedicated audit panel on the CEO's command console. HQ can instantly track high cancellation rates per branch to uncover floor-level collusion patterns.
Under-declaring the price at checkout (e.g., Charging the customer ₱500 but manually typing ₱300 into the POS).	This loophole is completely dead. The receptionist has zero manual inputs for services or pricing at checkout. The exact amount (e.g., ₱300) is automatically pulled from the customer's initial phone selection when the staff taps the physical Seat Card to finalize the visit. The staff cannot change the value to pocket the difference.
"Sir, mahina ang Wi-Fi / down ang system natin ngayon."	This excuse is completely eliminated through a two-layer network safety net. First, the Staff Terminal utilizes a tablet equipped with a dedicated cellular SIM card on an unlimited data plan . If the primary fiber internet provider (e.g., PLDT, Globe) experiences an outage, the terminal instantly and automatically fails over to mobile data, maintaining real-time cloud connections. Second, if cellular networks are completely down as well, the system falls back on its Offline-First Sync Engine as a final catch. The customer's pre-selected services and the staff's card-based layout assignments are safely stored in the tablet's local cache memory. The exact locked-in transaction amount automatically pushes to the cloud ledger the very moment any internet connection returns, leaving the staff with zero options to modify, bypass, or delete the data.
Franchisee hiding true branch sales from the Franchisor HQ.	Franchisor HQ does not need to rely on manual sales reports submitted by the branch. The system automatically tracks every customer visit and transaction in real-time. It

	uses this data to instantly generate accurate Daily, Monthly, and Yearly sales reports that the branch cannot change. Furthermore, because customers always scan the screen to collect their loyalty rewards, every point given out creates a digital paper trail. HQ can easily compare the number of points issued against the revenue reported by the branch. A branch cannot claim it had low sales if the system shows its customers were heavily collecting points.
--	--

4. Reports

The system provides unalterable, customer-verified analytics split across custom intervals:

- **Daily Operations Report:** Captures live gross revenue, individual barber commission breakdowns, and real-time product inventory counts (e.g., pomades sold off shelves).
- **Monthly Royalty Reconciliation:** Automatically calculates the exact percentage fee owed to the Franchisor HQ based directly on verified customer checkouts.
- **Quarterly & Yearly Trend Analysis:** Compares performance across separate Pablings branches, tracking customer retention rates, average visit frequencies, and total loyalty liabilities.

5. Automated SMS System Triggers

- **On-Checkout:** *"Thank you for visiting Pablings! You earned 30 points. Total balance at this branch: 120/200."* (Acts as a digital receipt and confirmation that the sale was officially registered).
- **30-Day Nudge:** *"Hey [Name], it's been 30 days since your last fresh cut at Pablings. Book your chair now!"*
- **60-Day Recovery:** *"We miss you at Pablings! Come back this week and get a 10% loyalty discount on your next service."*
- **Owner Emergency Alert:(optional)** *"ALERT: Branch A has an active session exceeding 90 minutes without a payment checkout."*
